<Results>

Bound[%] was calculated as follows: Subtract 218 which is average value of blank from all experimental values, then this value divides by (subtract 218 from 2980 which is average value of drug 0)(2980 - 218 = 2762) and multiply 100

total count = 7965 + 8280 + 8052 + 8325 / 4 = 8155 dpm 8155 / 60 dps = 136 Bq As I put 500  $\mu$ L from 800  $\mu$ L and measured radioactivity count 136 x 8 / 5 = 217 Bq 11.4 GBq / mg therefore 19 pg / tube

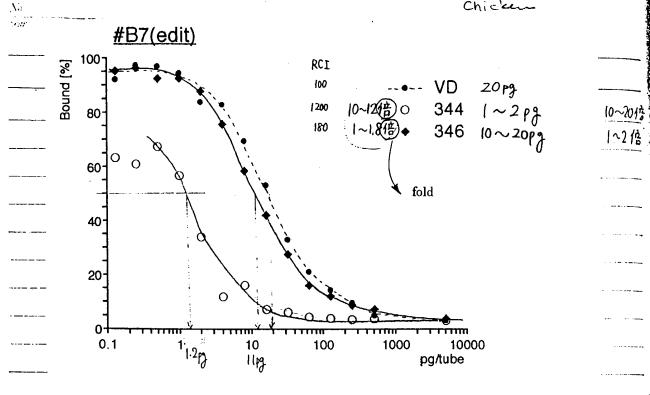

As average added amount is 16257 dpm

from 271 Bq
24 pg / tube 1

Approximately 80% of hot receptor exists in solution and the rest should absorb an inside wall of glass tube 217 Bq / tube = 217 / 4.85T / (50 + 500 + 50)  $\mu$ L = 0.075 nM

Or, it may exists as 1\alpha25(OH)2 and the rest may count of decompose stuff
